- You may ask for clarification but you are ultimately responsible for the answer you write on the paper.
- Illegible answers are wrong answers.
- SHOW YOUR WORK FOR PARTIAL CREDIT.
- Answers to True/False questions WITHOUT any justification get no credit.
- Please do not discuss this test by any means.
- Please look through the entire test before starting. WE MEAN IT!!!

Good luck!

0. (1 point, 0 min) (circle one; you get a point regardless of correct/incorrect answer) $\$

Bhraamari asana is another name for

- (a) Laugh yoga
- (b) Super brain yoga
- (c) Tree pose
- (d) Bee sound while shutting out visual and auditory inputs
- (e) Don't know what you are talking about

Performance

1. (10 points, 5 min)

An architecture has three types of instructions that have the following CPI:

Type CP A 2 B 7 C 3

An architect determines that he can reduce the CPI for B to 5, with no change to the CPIs of the other two instruction types, but with an increase in the clock speed of the processor. What is the maximum permissible increase in clock cycle time that will make this architectural change still worthwhile? Assume that all the workloads that execute on this processor use 20% of A, 20% of B, and 60% of C types of instructions.

Pipelining

2. (Total 15 points, 10 min)

(a) (3 points) (Answer True/False with justification) "Delayed branch technique stops issuing new instructions into the pipeline until the outcome of the branch is determined."

(b) Assume the pipeline has busy bit (B), Read Pending signal (RP), and register forwarding in answering this question. Given the following sequence of instructions:

I1: add R1, R2, R3; R1 <- R2 + R3 I2: add R1, R3, R4; R1 <- R3 + R4 I3: sub R5, R1, R7; R5 <- R1 + R7

(i) (2 points) what potential hazards exist in the above instruction sequence?

(ii) (6 points)

Show the passage of these instructions through the 5-stage pipeline by filling in the table below

Cycle	IF	ID/RR	EX	MEM	WB
Number					
1	I ₁				
2					
3					
4					
5					
6					
7					
8					
9					
10

(c) Recall that the branch target buffer (BTB) records the past history of the outcomes of a given branch instruction execution to make a decision on future branch prediction. Given the contents of the branch target buffer as shown below for the currently executing program:

PC of branch instr.	Past history (left is	Target of branch
	most recent)	
1000	NNTTTTNTTT	1400
1500	TTTTTNNNN	2000
2000	TNNNNNNT	4000

(T: branch taken; N: branch not taken)

(i) (2 points) Branch instruction at address 1000 enters the pipeline. From which memory address will the next instruction be fetched and fed into the pipeline?

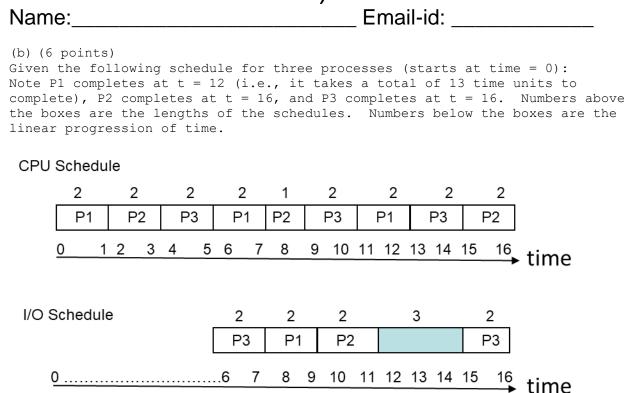

(ii) (2 points) (Answer True/False with justification)
"The strategy in (i) will always eliminate branch induced bubbles in the
pipeline."

Process Scheduling

3. (15 points, 10 min)

(a) (5 points)

Explain (with 3 or 4 concise bullets) the purpose of Process Context Block (PCB)

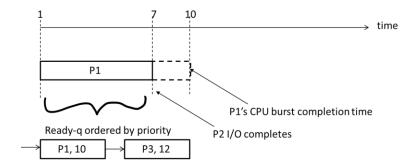

(i) (4 points) What is the average waiting time experienced by the processes in the above schedule?

(ii) (2 points) What is the average throughput of the system?

Name:	Email-id:

(c) (4 points)

The scheduling discipline used is **priority (lower number higher priority) with preemption.** Given the timeline below:

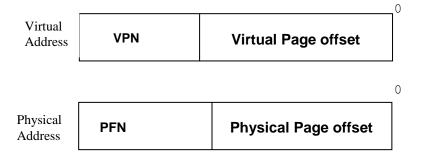

- P1 (priority = 10) is executing currently; (Ready queue is as shown above)
- P2 (priority = 5) completes I/O at time = 7
- (i) (2 points) Show the new Ready queue (with all the processes) at time 7

(ii) (2 points) Explain which process will run next on the CPU, and why?

Name:	Email-id:
Virtual Memory	(Note: K = 1024), Working set

- 4. (16 points, 10 min)
- (a) Consider a memory system with 48-bit virtual addresses and 32-bit physical addresses. The page size is $4~{\rm KB}$.
- (i) (4 points) Assuming little-endian notation show the bit positions occupied by the VPN, Virtual Page Offset, PFN, and the Physical Page Offset in the figures below.

- (ii) (2 points) How many entries are there in the page table?
- (iii) (2 points) How many page frames are there in the memory system?
- (b) During the time interval t1 t2, the following virtual page accesses are recorded for the three processes P1, P2, and P3, respectively.

```
P1: 0, 10, 1, 0, 1, 2, 10, 2, 1, 1, 0, 25
P2: 0, 100, 101, 102, 103, 0, 101, 102, 104, 0, 105
P3: 0, 1, 2, 3, 4, 5, 0, 1, 2, 3, 4, 5, 0, 1, 2, 3, 4, 5
```

- (i) (6 points) What is the working set for each of the above three processes for this time interval?
- P1:
- P2:
- P3:
- (ii)) (2 points) What is the cumulative memory pressure on the system during this interval?

Name:	Email-id:

Demand paging, page replacement

5. (13 points, 10 min)

(a) (2 points) (Answer True/False with justification)

"With page-based virtual memory system there is no internal fragmentation."

(b) (2 points) A 32-bit architecture, has a 16-bit page offset and 16 bit VPN. If the VPN = 0x0000 maps to PFN = 0x0FFE, show the **full 32-bit** physical address corresponding to the virtual address 0x000035FE.

(c) (2 points) The clock algorithm you implemented in your project as an approximation to LRU algorithm is referred to as "second chance replacement" algorithm. Why?

(d) (2 points) The current content of the TLB is as shown below (U - user entries; K - kernel entries)

01101100, 11	11021102 011	/	
USER/KERNEL	VPN	PFN	VALID/INVALID
U	0	122	V
U	XX	XX	I
U	10	152	V
U	11	170	V
K	0	10	V
K	1	11	V
K	3	15	V
K	XX	XX	I

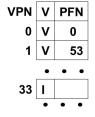

Mark in the above table changes to the TLB upon a context switch

Cache Design, Execution time (Note: K =	1024; M = 1024*1024)					
(Total 13 points, 10 min)(a) (3 points) Associate definitions belochoosing from	ow (A, B, C) with the type of miss					
compulsory miss, conflict miss, capacity miss.						
A. Miss incurred when the cache is full B. Miss incurred since memory location accessed for the first time by CPU C. Miss incurred due to limited associativity even though the						
cache is not full						

- (b) (10 points) In a pipelined processor
 - average CPI = 1.3 without accounting for memory stalls.
 - I-Cache has a **hit rate** of 98%
 - D-Cache has a hit rate of 99%
 - Memory reference instructions account for 30% of all the instructions executed
 - \bullet Out of these memory reference instructions 80% are loads and 20% are stores.
 - Read-miss penalty (for instruction or data) is 100 cycles
 - Write-miss penalty is 5 cycles.

Compute the effective CPI of the processor accounting for the memory stalls.

Name:			 Email-id:					

7. (Total 17 points, 15 min)

(a) (2 points)

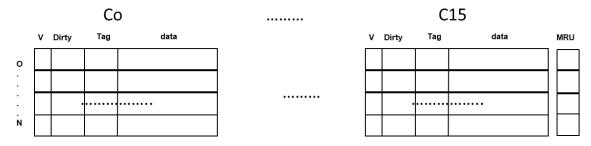

How is the principle of spatial locality exploited in cache design?

(b) (2 points)

How is the principle of temporal locality exploited in cache design?

(c) (13 points)

Consider a 16-way set associative cache with the following parameters:

- Cache size (i.e, the amount of actual data it can hold) of 1 Mbytes.
- 32-bit byte-addressable memory.
- Each memory word contains 4 bytes
- cache block size is 64 bytes.
- write-back policy. One dirty bit per word.
- one valid bit per block.
- MRU field that records the most recently cache for that cacheline
- (i) (3 points) How big is N in the above picture (show your work)?

Name:		Em	ail-id:			
(ii) (6 points) and index as sl		ry address is spl	it into	block	offset,	tag,
Cache Tag	Cache Index	Block Offset				
t	n	b				

As shown above, the memory address is partitioned into \mathbf{b} - the number of bits for the block offset; \mathbf{n} - the number of bits for the cache index; and \mathbf{t} - the number of bits for the tag. What are the values of \mathbf{t} , \mathbf{n} , and \mathbf{b} (show your work)?

(iii) (4 points) How many meta-data bits are there totally for the entire cache as shown in the above picture? (show your work)
[Note: Remember that meta-data refers to all the other stuff (besides the data itself) that goes into cache.]

Name:	Email-id:

Acronyms

IF - instruction fetch (fetch into IR and increment PC)
ID/RR - instruction decode/register read (read register contents)
EX - execute (perform arithmetic/logic/address computation - maybe)
MEM - memory (fetch/store memory operand - maybe)
WB - write back to register file (may be)
TLB - Translation Look-aside Buffer
PTE - Page Table Entry
PFN - Physical Frame Number
VPN - Virtual Page Number
RLT - Reverse Lookup Table
PCB - Process Control Block
FCFS - First Come First Served
SJF - Shortest Job First
SRTF - Shortest Remaining Time First

Name	Notation	Units	Description
CPU Utilization	-	%	Percentage of time the CPU is busy
Throughput	n/T	Jobs/s	System-centric metric quantifying the number of jobs <i>n</i> executed in time interval <i>T</i>
Avg. Turnaround time (t _{avg})	$(t_1+t_2+\dots+t_n)/n$	Secs	System-centric metric quantifying the average time it takes for a job to complete
Avg. Waiting time (w _{avg})	(w ₁ +w ₂ + +w _n)/ n	Secs	System-centric metric quantifying the average waiting time that a job experiences
Response time	\mathbf{t}_i	Secs	User-centric metric quantifying the turnaround time for a specific job <i>I</i>
Variance in Response time	$E[(t_i - t_{avg})^2]$	Secs ²	User-centric metric that quantifies the statistical variance of the actual response time (t_i) experienced by a process (P_i) from the expected value (t_{avg})
Starvation	-	-	User-centric qualitative metric that signifies denial of service to a particular process or a set of processes due to some intrinsic property of the scheduler
Convoy effect	-	-	User-centric qualitative metric that results in a detrimental effect to some set of processes due to some intrinsic property of the scheduler

Name:	Email-id:
-------	-----------

Name	Notation	Units	Comment
Memory footprint		Bytes	Total space occupied by the program in memory
Execution time	$(\sum CPI_j)$ * clock cycle time, where $1 \leq j \leq n$	Seconds	Running time of the program that executes n instructions
Arithmetic mean	$(E_1+E_2++E_p)/p$	Seconds	Average of execution times of constituent <i>p</i> benchmark programs
Weighted Arithmetic mean	$(f_1*E_1+f_2*E_2++f_p*E_p)$	Seconds	Weighted average of execution times of constituent <i>p</i> benchmark programs
Geometric mean	p^{th} root $(E_1*E_2**E_p)$	Seconds	p^{th} root of the product of execution times of p programs that constitute the benchmark
Harmonic mean	$1/(((1/E_1) + (1/E_2) + + (1/E_p))/p)$	Seconds	Arithmetic mean of the reciprocals of the execution times of the constituent p benchmark programs
Static instruction frequency		%	Occurrence of instruction <i>i</i> in compiled code
Dynamic instruction frequency		%	Occurrence of instruction <i>i</i> in executed code
Speedup (M _A over M _B)	$\rm E_B/E_A$	Number	Speedup of Machine A over B
Speedup (improvement)	$E_{ m Before}/E_{ m After}$	Number	Speedup After improvement
Improvement in Exec time	$(E_{old}-E_{new})/E_{old}$	Number	New Vs. old
Amdahl's law	$\begin{aligned} & \text{Time}_{after} \\ & = \text{Time}_{unaffected} + \text{Time}_{affected} / x \end{aligned}$	Seconds	x is amount of improvement

Execution time = N * CPI_{Avg} * cycle time

Execution time = $N * CPI_{eff} * cycle time$

 $CPI_{eff} = CPI_{Avg} + Memory-stalls_{Avg}$

Execution time = $N * (CPI_{Avg} + M-stalls_{Avg}) * cycle time$

 $Memory\text{-stalls}_{\mathsf{Avg}} = {}_{\mathsf{misses}\,\mathsf{per}\,\mathsf{instruction}_{\mathsf{Avg}}}{}^{\star}\,\mathsf{miss\text{-penalty}}_{\mathsf{Avg}}$

Total memory stalls = N * Memory-stalls_{Avg}
